

Anurag Jha

Aspiring Software Engineer

✉ anuragjha0200@gmail.com  LinkedIn  GitHub  LeetCode

SKILLS

- Programming Languages - Python, Java, Javascript, C, SQL
- Frameworks/Libraries: FastAPI, Spring Boot, Node.js, Scikit Learn, React, Tailwind CSS, Numpy, Pandas, Matplotlib
- Databases - PostgreSQL, MongoDB, H2 Database
- Core Competencies - Data Structures and Algorithms (DSA), Object Oriented Programming (OOPs), Machine Learning
- Developer Tools - GitHub, DockerHub, Antigravity, Codex,

EDUCATION

B.Tech in Information Technology, Techno Main
2nd year

CERTIFICATES

Supervised Machine Learning 

HACKATHONS

NIT Agartala Arjuna 2.0 
Secured 3rd Place

PROJECTS

UPImesh | Offline-First Distributed Payment Engine

Tech Stack: Java, Spring Boot, PostgreSQL, Spring Security

- Architected an offline-first payment backend utilizing a store-and-forward mesh architecture for UPI transactions without internet access.
- Secured data transmission across untrusted devices using hybrid encryption (RSA-OAEP + AES-GCM), cryptographic nonces, and timestamps.
- Engineered an idempotency engine enforcing ACID transactions and optimistic locking to guarantee exactly-once execution and prevent double-spending.

Project Demonstration Video - <https://youtu.be/oJdq17pC-A4> 

DocSaathi | AI-Powered Telemedicine Platform

Tech Stack: Next.js 15, PostgreSQL, Prisma, Clerk, Groq AI, PWA, Tailwind CSS

- Developed a full-stack telemedicine PWA featuring secure video consultations, AI symptom triage, and role-based access for patients and doctors.
- Designed offline-first infrastructure (Service Workers, IndexedDB) and rural healthcare features, including SMS appointment booking and ASHA worker dashboards.
- Streamlined clinical workflows by integrating AI-powered prescription OCR, multilingual voice-note transcription, and QR-based patient IDs.

Deployment Link - <https://doc-saathi.vercel.app/> 

Food Delivery Time Prediction Using Machine Learning

Tech Stack: Python, Pandas, Scikit-learn, XGBoost, FastAPI, React, Docker, AWS

- Architected a robust data preprocessing pipeline using One-Hot Encoding to optimize results for tree-based algorithms, and trained a XGBoost Regressor model that achieved the highest R^2 score for precise, location-based delivery estimates.
- Engineered a modular REST API using FastAPI to serve the serialized machine learning model, deploying the scalable backend infrastructure on AWS
- Fully containerizing the application ecosystem with Docker for seamless deployment. Developed a responsive client interface with React and Vite

Deployment Link - <https://food-delivery-eta-ml.vercel.app>
